                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                              An endoplasmic reticulum stress transcription factor (bZIP) and ccapable of regulating transcription inducing activity exhibited by an CC capable of regulating transcription inducing activity exhibited by an CC element (ERSE) can be used in a method for controlling expression of CC an endoplasmic reticulum chaperone. The method comprises expressing CC bZIP. The method can be used for expression of a foreign protein by CC positively regulating expression of an endoplasmic reticulum consperone either positively or negatively in CC central and therefore is useful for treatment or prophylaxis of CC central and therefore is useful for treatment or prophylaxis of CC cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, the CC expression of a foreign protein. This sequence taken from the CC expression of a foreign protein (GRP) promoter GRP78 contains an ERSE like

                                                                                                                                                                                                                                                                                                                                                                                                                                                             An endoplasmic reticulum stress transcription factor (b2IP) an capable of regulating transcription inducing activity exhibited by an capable of regulating transcription inducing activity exhibited by an endoplasmic reticulum chaperone. The method comprises expressing an endoplasmic reticulum chaperone. The method comprises expressing b2IP. The method can be used for expression of a foreign protein by b2IP. The method can be used for expression of an endoplasmic reticulum positively regulating expression of an endoplasmic reticulum chaperone gene. b2IP is useful for controlling the expression of chaperone gene. b2IP is useful for controlling the expression of
                                                                                                                                                                                                                                                                                           endoplasmic reticulum chaperone either positively or negatively in endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the expression of a foreign protein (GRP) promoter GRP78 contains an ERSE lightcose regulating protein (GRP) promoter GRP78 contains an ERSE lightcose regulating protein (GRP) promoter GRP78 contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        endoplasmic reticulum stress transcription factor (known as bZIP) controlling expression of endoplasmic reticulum chaperone, useful treating cancers, arteriosclerosis, cystic fibrosis, ischemic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An endoplasmic reticulum stress transcription factor (bZIP) an capable of regulating transcription inducing activity exhibited by an capable of regulating transcription inducing activity exhibited by an endoplasmic reticulum chaperone. The method comprises expressing an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by bZIP. The method can be used for expression of a foreign protein by chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in endoplasmic reticulum chaperone either positively or negatively in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-NOV-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New endoplasmic reticulum stress transcription factor (known as bZIP) for controlling expression of endoplasmic reticulum chaperone, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haze K, Yoshida H,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (HSPR-) HSP RES INST INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 1; Fig 3; 157pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    An endoplasmic reticulum stress transcription factor (bZIP)
C capable of regulating transcription inducing activity exhibited by an CC element (ERSE) can be used in a method for controlling expression of CC an endoplasmic reticulum chaperone. The method comprises expressing CC positively regulating expression of a nedoplasmic reticulum chaperone of a foreign protein by CC chaperone gene. bZIP is useful for controlling the expression of cendoplasmic reticulum chaperone either positively or negatively in CC cells and therefore is useful for treatment or prophylaxis of CC cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, CC the endoplasmic reticulum chaperone and thereby increases the CC cancers of a foreign protein. This sequence taken from the correct conformation of CC capression of a foreign protein. This sequence taken from the
                                                                                                                                                                                                                                                                                                                                               Matches

This sequence taken from the glucose regulating protein (GRP) promoter GRP94 contains an ERSE like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of

The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in
                                                                                                                                                                                                                                                                 Endoplasmic reticulum; stress; ER; transcription factor; transcription; regulatory element; ERSE; bZIP; chaperone; trea prophylaxis; cancer; arteriosclerrosis; ischaemia; wound healin cystic fibrosis; ulcer; gene therapy; recombinant gene; mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the calreticulin (CRT) promoter contains an ERSE like sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (ERSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                              The present invention relates to a method for screening a substance for controlling ORP150 expression. The method comprises examining the expression of a reporter gene product in the presence of a cell strain transformed by a vector. In the vector, the reporter gene is connected downstream of the promotor region of ORP150 gene and a sample to be tested. The method can be used to obtain drug compositions which alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (BRSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bZIP The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in

Targeted gene expression is tool used for gene therapy of diseases and CC is based on 2 main strategies: (1) targeted entry of a heterologous CC nucleic acid to a host cell; and (2) specific tissue or cell expression CC of the heterologous gene. In general, heterologous gene expression CC general purpose Murine Leukaemia Virus (MuLV) Long Terminal Repeat (LTR) CC promoter sequence. Promoters such as these sometimes fail to adequately CC express the heterologous gene in a biologically stressed environment. CC at least one stress-responsive non-coding regulatory sequence comprising CC at least two copies of an endoplasmic reticulum stress element (ERSE). CC The preferred ERSE of the invention is the sequence shown here which cC corresponds to a glucose responsive protein (grp) 78 gene promoter ERSE. CC The construct also comprises a heterologous nucleic acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAF28780

An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (EREE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           operatively linked to the regulatory sequence, where expression of the heterologous sequence is regulated by the non-coding sequence and where the heterologous sequence encodes a therapeutic agent effective for provided a cell proliferative disorder or for treating a disorder or associated with glucose starvation or a detectable marker. The invention possibly associated with inflammation, for example meoplastic disorders such as lung cancer, colon-rectum cancer, breast cancer, prostate cancer, urinary tract cancer, uterine cancer lymphoma, oral cancer, pancreatic brain cancer and ovarian cancer. The invention is also useful for cancer, colon-human transgenic animals of the invention is also useful for cancer.

Non-human transgenic animals of the invention include vertebrates such as any colon-human primary enters such as diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Endoplasmic reticulum; stress; ER; transcription factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ABQ00200;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WO200216649-A2.
                                                                                                  The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in AB000010-AB013409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (AB000010-AB013409) to a target nucleic acid to form a modified target (AB000010-AB013409) to a target nucleic acid to form a modified with (I). nucleic acid and contacting the modified target nucleic acid with (I) the steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                27-AUG-2001; 2001WO-US26519.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28-FEB-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic
                                                                                                                                                                                                                                                                                                                   25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid and target nucleic acid with (I). nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target which further comprises detecting the presence of the modified target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gunderson K;

                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). which further comprises detecting the presence of the modified target nucleic acid, which further comprises detecting the presence of the modified target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid acid target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABQ10726 standard; DNA; 24 BP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). Which further comprises detecting the presence of the modified target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 24 BP; 4 A; 5 C; 9 G; 6 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an oligonucleotide array (1) comprising at least

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-FEB-2002
                                                                                                                                                                                                                     The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a dapter nucleic acid and contacting the modified target nucleic acid and contacting the modified target nucleic acid with (I). nucleic acid and contacting the modified target nucleic acid, The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target middle target middle target middle target middle target middle target which further comprises detecting the presence of the modified target which further comprises detecting the presence of the modified target
                                                                                                                                                                                                                                                                                                                                                                                                                      Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising

                                                                                                                                                         pcR primers (see AAV45529 and AAV45530) are designed for the PCR amplification of the Helicobacter pylori ureg gene. The invention relates to recombinant DNA (see AAV62460-61) comprising a fusion gen prepared by ligating an antigenic determinant coding gene (e.g. the prepared by ligating an antigenic determinant coding gene (b.g. the ureg gene) of H. pylori and A2 and B subunit genes of Vibrio cholerae. Also claimed are chimeric proteins (see AAW80599-600) cholerae. Also claimed are chimeric proteins (see AAW80599-600) cholerae. Also claimed are chimeric production of the chimeric proteins, and use of the chimeric proteins in preventative and therapeutic vaccines for H. pyloriproteins in preventative and therapeutic vaccines for H. pyloriproteins diseases such as gastritis, gastric ulcer, duodenal associated diseases such as gastritis, gastric ulcer, duodenal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html" a 20 c 21 g 19 t 2 others

The larvae were recovered by overnight passage on a Baermann apparatus, and then cleaned by passage through a 20 micron nylon mesh. The larvae were then subjected to a treatment with 1.25% chlorox to induce excystation. The larvae were washed with 5 changes of PBS and then pelleted and snap frozen in liquid nitrogen."

                                                                                                                                                       note="organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site_1: BamHI; Site_2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids DH10B
                                                                                                                        cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgJII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

The cDNA library was prepared using the Stratagene pBluescript II XR library construction kit. Complementary DNA was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /db_xref="taxon:3847"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        library (UIR-C3) was constructed as follows: PCRamplified cDNA inserts from UIR-C2p clones from which 3' ESTs had been derived was used as a driver in a hybridization with the UIR-C2p library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the UIR-C3 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:791-806, 1996)"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pBlueScript backbone); Site 1: BamHI; Site 2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was 'RescueMu.' and lasf punches, double digested using BamHI extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B and By were transformed and then screened on LB plates with

Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ampicillin."
